
Linking external accounts and services

To enable synchronisation of user accounts (automatic creation of accounts, synchronisation of passwords with CAS), we offer the possibility of sending notification of data about users in XML format. Using LDAP protocol or web service, one can thus gather information both about changes in the user data (changes of work relations, identity cards, etc.) but also about changes of passwords. Implementation of this service enables the faculty to automate the creation, cancellation, and blocking of user accounts and synchronisation of passwords with the CAS.

At the moment, there are implementations for:

- Microsoft AD domains,
- Google Apps,
- Office365.

Given the possibility of using a general XML data format one can, however, implement synchronisation for almost any system.
